

USCCG's business intelligence portal gives you the information you need, when and where you need it

Key Features

- Stores and organizes operational reports, documents, and content in one central location
- Generates alerts when data and documents are updated and when KPIs exceed user-defined thresholds
- Allows navigation via unique organizational tree structure to find relevant information with drill down and up capability
- Enables user to aggregate and repurpose Line of Business information
- Provides comprehensive control over the way you store, search, secure, distribute, reuse, aggregate, visualize, summarize, and deliver enterprise knowledge
- Allows you to modify repository settings to add workflow, define retention policies, and add new nameplates/content types
- Enables customized reporting policies to control item level (SKU) access rights, retention period, expiration actions, and document auditing settings
- Provides a single integrated location for employees and business partners to find organizational resources, access corporate knowledge, and leverage business insight
- Integrates with familiar client applications for easy compliance
- Extensible design allows custom configuration to suit unique business needs
- Leverages existing databases and legacy systems
- Rapid deployment methodology shortens time-to-value
- Based on Microsoft Office SharePoint Server® enterprise platform

Proxim-IT's™ integrated suite of applications optimizes the way people, content, and processes interact within any organizational structure

Proxim-IT allows you to visualize your business through dashboards, graphics, tables, and lists, transforming data into knowledge and action.

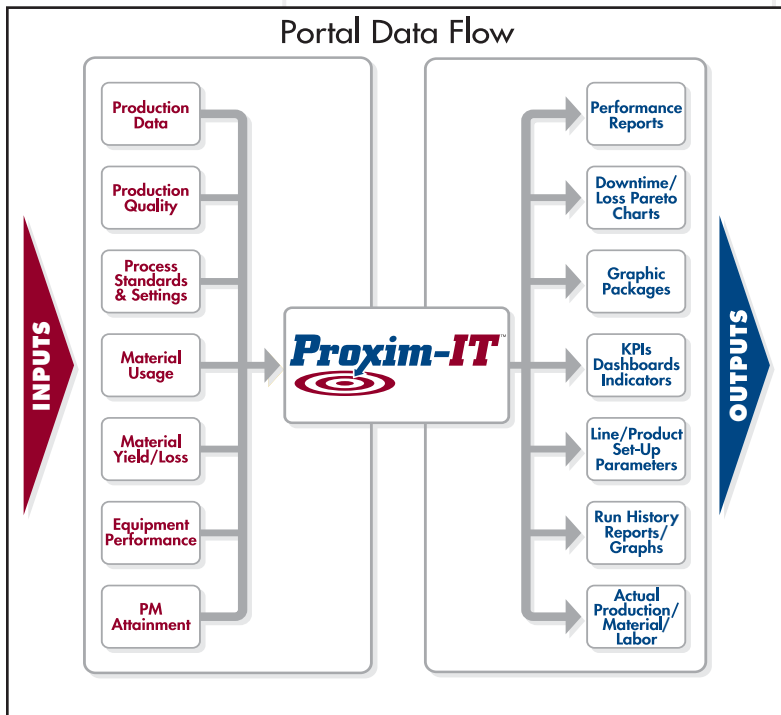

Today's best performing companies are also the most knowledgeable. When it comes to decision making, whether at the strategic, operational, or tactical level, they have the information they need, when they need it, to make timely, fact-based decisions.

One of the most important services we provide our clients is helping them become smarter by transforming their data, through our enabling technology, into business intelligence. Our business intelligence portal, Proxim-IT, collects, aggregates, displays, and delivers operational, financial, and organizational information securely via a web-based application to your desktop or laptop computer, phone, or PDA.

It provides comprehensive control over electronic content, accelerating shared business processes, facilitating better informed decision making, and enhancing communications and enterprise collaboration.

More accessible organizational metrics can improve decision making

Proxim-IT leverages existing databases and legacy systems' data sources.

First we make it work. Then we make it last.®

Proxim-IT™ is a trademark of USC Consulting Group, LLC

Visibility drives teamwork, innovation, and business productivity
Proxim-IT does more than just aggregate and display data. It can provide everyone in an organization near-real-time visibility into corporate objectives, as well as the KPIs relative to their own particular role in achieving them. Plus, its underlying technology enables us to model a client's enterprise or organizational structure from one end to the other. We actually model all of the departments, divisions, work centers, and production areas to enable complete drill down capability. We include the objectives of each area, and illustrate how they cascade up and down the various lines of business.

Unique rapid deployment methodology accelerates time-to-value
By coupling operational subject matter expertise with our unique rapid portal deployment methodology, we can accelerate the implementation process to achieve the best time-to-value in the marketplace. Although deployment time can vary due to circumstances, our iterative model normally starts delivering value in as little as four weeks at a pilot site.

We start with a requirements analysis to assess the scope, and outline deliverables and content. Then, using our administrative toolkit, we start configuring basic input and output functions so actual users are able to review the solution as a work in process. This enables them to provide valuable insight into the final design, while using business intelligence to make fact-based decisions at any stage in the production process.

Under favorable conditions, implementations can take as little as twelve weeks for installation, configuration, testing, and user training.
